
A BILL FOR AN ACT

RELATING TO THE PACIFIC INTERNATIONAL SPACE CENTER FOR
EXPLORATION SYSTEMS.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF HAWAII:

1 PART I

2 SECTION 1. Pursuant to Act 169, Session Laws of Hawaii
3 2012, and Act 273, Session Laws of Hawaii 2013, Pacific
4 international space center for exploration systems was
5 established to support the development of a world-class center
6 of excellence in Hawaii to facilitate the design, testing and
7 validation of new technologies to support both robotic and human
8 missions to space. The ultimate goal of Pacific international
9 space center for exploration systems is to establish an
10 aerospace research and development park that will serve as an
11 economic driver for the State, promoting the establishment and
12 growth of new sustainable and green industries; associated jobs;
13 workforce development; internships; and science, technology,
14 engineering, and math education programs.

15 In concert with this goal, Pacific international space
16 center for exploration systems has been working with the
17 department of accounting and general services, along with

1 Ferraro Choi and Associates, to design a state-of-the-art
2 facility in Hawaii that can accommodate the growing interest
3 expressed by the National Aeronautics and Space Administration,
4 international space agencies, and the commercial space sector in
5 using our State's unique lunar and Mars analog sites to develop,
6 test and validate communications, renewable energy, advanced
7 manufacturing, and other technologies that can support planetary
8 exploration, as well as innovative applications of these
9 technologies to enhance the qualities of life in Hawaii (such as
10 the development of three dimensional printing that can utilize
11 local basaltic materials, as an alternative to imported
12 concrete, for construction).

13 The near-term objective of the Pacific international space
14 center for exploration systems is to develop a testing and
15 checkout facility to accommodate the assembly of space hardware,
16 software loading, interface verification, electro-mechanical
17 analysis, and other critical analyses prior to demonstrating and
18 evaluating these technologies and integrated systems at the
19 Pacific international space center for exploration systems field
20 sites on the island of Hawaii. An operations control room would
21 also be outfitted to support data processing, command and
22 control, and uplink interfaces with spacecraft, as well as to

1 serve as a command and operations center for the laser optical
2 communications ground station proposed for the island of Hawaii.

3 The Pacific international space center for exploration
4 systems has also generated significant interest in applied
5 research and development for planetary surface systems
6 technologies, with participation from the federal, public, and
7 private sectors, as well as universities and international
8 organizations. Furthermore, the Pacific international space
9 center for exploration systems has demonstrated considerable
10 progress toward advancing these technologies using the world-
11 class, basaltic planetary analog test sites uniquely found in
12 the Hawaiian Islands.

13 Research and development in areas of planetary
14 sustainability and resource utilization continue to demonstrate
15 considerable potential for advancing dual-use technologies that
16 can assist the State of Hawaii in becoming increasingly self-
17 sufficient in renewable energy, broadband communications,
18 advanced manufacturing, and other critical areas for
19 development, as well as provide multiple opportunities for
20 economic and workforce development through strategic
21 partnerships with both public and private research and
22 development entities nationwide and overseas.

1 As such, the Pacific international space center for
2 exploration systems should continue to explore and pursue
3 research and development programs for planetary surface system
4 technologies in five strategic areas. These five strategic
5 areas include:

6 (1) Basaltic construction and fabrication. Three
7 dimensional printing is being developed and utilized
8 to support a broad range of applications in
9 architecture, civil engineering, robotics, and
10 aerospace. Pacific international space center for
11 exploration systems research in basaltic concrete and
12 construction has the potential for advancing multiple
13 technologies in additive manufacturing for rapid
14 prototyping, parts production, and construction using
15 three dimensional printing with novel materials.

16 For example, cement is the traditional "glue"
17 that holds aggregates together to form concrete.
18 Producing cement is an energy-intensive process that
19 is estimated to account for five to seven per cent of
20 global carbon dioxide emissions. Hawaii pays a
21 premium for cement and imports over three hundred
22 thousand metric tons per year to meet demand. This

1 represents large economic and environmental costs to
2 the State.

3 Pacific international space center for
4 exploration systems can help reduce these imports (and
5 associated costs) by partnering with the University of
6 Hawaii, the National Aeronautics and Space
7 Administration, and other industry experts to perform
8 applied research that can characterize and mature
9 alternative binder technologies (using indigenous and
10 "waste" by-products in Hawaii) to produce basalt-based
11 construction materials for building homes, highways,
12 and other structures statewide.

- 13 (2) In-situ resource utilization. A key requirement for
14 space exploration is the ability to "live off the
15 land" using indigenous resources found on planetary
16 surfaces. Pacific international space center for
17 exploration systems has acquired a planetary rover on
18 long-term loan from Ontario Drive and Gear in Canada
19 that will enable the development, testing, and
20 validation of integrated resource extraction
21 technologies. The goal is to develop and demonstrate
22 end-to-end technologies associated with "dust to

1 thrust" capabilities - that is, extracting oxygen from
2 Hawaii basalts, filtering water, separating the water
3 into hydrogen/oxygen gases, pumping the gases into a
4 hydrogen fueling station, and transferring gases from
5 the refueling station into gas cylinders on the rover
6 - which in turn will expand Hawaii's role as a premier
7 site for the development, testing, and validation of
8 planetary surface system technologies.

- 9 (3) Planetary analog test site development. The island of
10 Hawaii's unique geology enables Pacific international
11 space center for exploration systems to provide a
12 world-class test site with terrain that closely
13 simulates the surface of the moon and Mars. Since
14 2007, the island of Hawaii has been used to support
15 robotic and other technology testing and validation by
16 the National Aeronautics and Space Administration,
17 private industry, and international space agencies.
18 The provision of additional power, mechanical systems,
19 and communications infrastructure required to enable
20 technology testing and validation requirements for
21 future robotic and human missions to the moon and Mars
22 on the island of Hawaii will secure Hawaii's role as a

1 global leader in the development of planetary surface
2 system technologies.

3 (4) Secondary school lunar surface flight experimentation.

4 The moon and Mars present difficult challenges to
5 exploration, chief among them being dust. Surface
6 dust consists mostly of a powder that is abrasive and
7 clings stubbornly to such surfaces as solar arrays,
8 radiators, viewports, and spacesuits. During the
9 Apollo missions, three days of exposure to the lunar
10 environment rendered some parts of spacesuits
11 unusable. There also is evidence suggesting this dust
12 may be electrostatically charged.

13 The National Aeronautics and Space
14 Administration's Kennedy Space Center has made some
15 remarkable breakthroughs in technologies to counter
16 this dust issue. The technique employed, through an
17 electric grid, has been shown to lift and transport
18 particles using electrostatic forces. This
19 technology, while working well in the laboratory, has
20 never been applied to space applications on the moon.

21 Pacific international space center for
22 exploration systems, in partnership with the National

1 Aeronautics and Space Administration's Kennedy Space
2 Center, NanoRacks, and three Hawaii-based high schools
3 will plan, design, develop and test a dust-removal
4 experiment to be flown on a 2015 Google lunar x-prize
5 mission to the lunar surface. Pacific international
6 space center for exploration systems has already
7 secured a grant valued at \$3,200,000 from the Google
8 lunar x-prize team to cover the transportation cost to
9 the lunar surface.

10 (5) International robotics mining competition development.

11 The National Aeronautics and Space Administration's
12 Lunabotics Challenge has been among the most
13 successful college-level robotics competitions.
14 Attracting the best and brightest from around the
15 world (involving fifty teams, one-third of which are
16 international), this event is held annually at the
17 National Aeronautics and Space Administration's
18 Kennedy Space Center and combines all the hallmarks of
19 science, technology, engineering, and math education,
20 space exploration, and teamwork, embracing a "failure
21 is not an option" attitude.

1 The National Aeronautics and Space Administration
2 has now refocused this event as a national competition
3 for college teams targeting Mars. There is also a
4 demand for a global competition with college engineers
5 and space science students, and Pacific international
6 space center for exploration systems is working with
7 international aerospace contacts to foster regional
8 competitions modeled on the National Aeronautics and
9 Space Administration's Lunabotics Challenge.

10 The purpose of this Act is to foster the development of
11 technologies that will expand and diversify economic and
12 workforce development opportunities statewide and advance
13 Hawaii's leadership in the aerospace field by:

- 14 (1) Appropriating funds for the Pacific international
15 space center for exploration systems to explore and
16 pursue research and development programs for planetary
17 surface system technologies in five strategic areas;
18 and
- 19 (2) Authorize the issuance of general obligation bonds to
20 support development of the Pacific international space
21 center for exploration systems testing facility and

1 operations control room for a proposed research and
2 development park.

3 PART II

4 SECTION 2. There is appropriated out of the general
5 revenues of the State of Hawaii the sum of \$1,375,738 or so much
6 thereof as may be necessary for fiscal year 2014-2015 for
7 Pacific international space center for exploration systems for
8 the exploration and pursuit of research and development programs
9 for planetary surface system technologies in five strategic
10 areas including basaltic construction and fabrication; in-situ
11 resource utilization; planetary analog test site development;
12 secondary school lunar surface flight experiments; and
13 international robotics mining competition development; provided
14 that the sum of \$730,738 shall be used for personnel costs,
15 operational expenses, and general and administrative expenses of
16 the Pacific international space center for exploration systems
17 to carry out the purposes of this part and the sum of \$645,000
18 shall be used for the research and development programs for
19 planetary surface system technologies.

20 The sum appropriated shall be expended by the department of
21 business, economic development, and tourism for the purposes of
22 this part.

PART III

SECTION 3. The director of finance is authorized to issue general obligation bonds in the sum of \$1,500,000 or so much thereof as may be necessary and the same sum or so much thereof as may be necessary is appropriated for fiscal year 2014-2015 for the development of a Pacific international space center for exploration systems research and development park; provided that of the appropriation authorized under this section, \$1,300,000 shall be used for land acquisition and \$200,000 shall be used for costs associated with the land acquisition including but not limited to subdivision approval process costs; property valuation appraisal report costs; land title search report costs; site environmental assessments; and pre-design tasks such as traffic studies, soil borings, and topographic surveys.

SECTION 4. The appropriation made for the capital improvement project authorized by this part shall not lapse at the end of the fiscal biennium for which the appropriation is made; provided that all moneys from the appropriation unencumbered as of June 30, 2016, shall lapse as of that date.

SECTION 5. The sum appropriated under this part shall be expended by the department of business, economic development, and tourism for the purposes of this part.

1

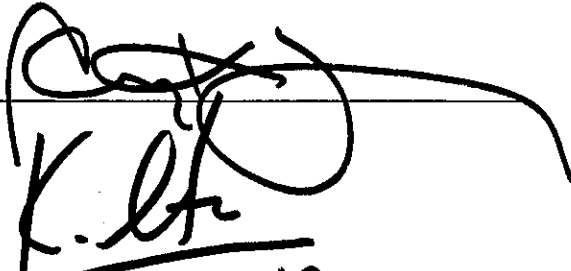

PART IV

2

SECTION 6. This Act shall take effect on July 1, 2014.

H.B. NO. 2472

Report Title:

Pacific International Space Center for Exploration Systems;
Program Development; Appropriation

Description:

Appropriates funds for the exploration and pursuit of research and development programs for planetary surface system technologies in specified areas. Authorizes the issuance of general obligation bonds for the development of a research and development park. Appropriation. Effective July 1, 2014.

The summary description of legislation appearing on this page is for informational purposes only and is not legislation or evidence of legislative intent.
