FROM: Michael Hamilton, MD

President, Hawaii Chapter of the American Academy of Pediatrics

RE: Testimony in Support; SB 2394, Relating to Influenza Immunization

My name is Michael Hamilton, MD. I am a pediatrician with Kaiser Permanente and I am the current President of the Hawaii Chapter of the American Academy of Pediatrics (HAAP). I represent a large percentage of the pediatricians in the state of Hawaii.

HAAP is in strong support of SB 2394 which would mandate annual flu vaccinations for health care workers. The influenza vaccine is a very effective way to prevent the spread of the flu virus. Despite long-standing recommendations by the Association for Professionals in Infection Control and Epidemiology (APIC), the Center for Disease Control and Prevention (CDC) and other national healthcare organizations, the response to voluntary programs has failed to increase immunization rates to acceptable levels required to significantly reduce healthcare-acquired influenza. In Hawaii, the health care worker vaccination level is in the bottom 10% for the entire nation.

Annual influenza-associated deaths range nationally from 3000 to 49,000 individuals. Many of these deaths are preventable. A very effective way of preventing annual influenza epidemics is through pre-exposure vaccination.

Ensuring that all of our health care workers receive the annual flu vaccine is good for the entire community. Mandatory vaccination programs help health care personnel carry out their professional duty to provide care to all patients without undue harm caused by influenza transmission. The public has a right to expect that health care workers and the institutions in which they work will take all necessary and reasonable precautions to keep them safe and minimize harm. Thank you for this opportunity to testify.

Sincerely,

A handwritten signature in black ink, appearing to read "R. Michael Hamilton".

From: Brian Pien, MD
Infection Control

Re: **Testimony in Support**
SB 2394, Relating to Influenza Immunization.

My name is Brian Pien, MD and I am in charge of infection control at Straub Clinic & Hospital. Straub Clinic & Hospital ("Straub") is a not-for-profit hospital in Honolulu, O'ahu, with 159 beds, a network of neighborhood clinics and a visiting specialist program that reaches throughout the state of Hawai'i. Straub is an affiliate of Hawai'i Pacific Health, the state's largest health care provider.

Straub is writing in **strong support** of SB 2394 which would require mandatory influenza vaccinations for health care workers.

In the United States, anywhere from 5% to 20% of the population contracts influenza every year and more than 200,000 people are hospitalized from seasonal flu-related complications and nearly 50,000 deaths per year. Together with pneumonia it is the 8th leading cause of death in the US and the 5th leading cause of death among those 65 years and older. Many of these deaths are preventable through vaccination. In 2013-2014, the CDC estimates that influenza vaccination prevented approximately 90,000 hospitalizations associated with influenza.

Mandatory vaccination programs help health care personnel carry out their professional duty to provide care to all patients without the threat of undue harm caused by influenza transmission. The influenza vaccine is safe with the most common side effect being a local reaction at the site with some soreness.

The first line of exposure is often hospital health care workers. Therefore ensuring those that have contact with patients first receive the annual influenza vaccination is the right thing to do and will go a long way in preventing both daily exposures to our patients as well as minimize the likelihood of an influenza outbreak. In Hawai'i where our islands has even greater risk through exposure from tourists worldwide, SB 2394 makes even more sense.

We ask that you pass SB 2394.
Thank you for the opportunity to testify.

From: James Kakuda, MD
Chief Medical Officer
Pali Momi Medical Center

Re: **Testimony in Support**
SB 2394, Relating to Influenza Immunization

My name is James Kakuda and I am the Chief Medical Officer at Pali Momi Medical Center. Pali Momi is a not-for-profit hospital located in West O'ahu, and is dedicated to the health and well-being of all Hawai'i residents. With 128 beds and more than 400 physicians on its medical staff, Pali Momi offers a full range of services. The hospital is an affiliate of Hawai'i Pacific Health, the state's largest health care provider.

Pali Momi is writing in **strong support** of SB 2394 which would require mandatory influenza vaccinations for health care workers. According to the Centers for Disease Control (CDC) - influenza-associated deaths have been estimated to be as much as 49,000 per year. Additionally, the CDC estimates that influenza vaccination prevented approximately 7.2 million illnesses, 3.1 million medically attended illnesses, and 90,000 hospitalizations associated with influenza in the 2013-14 influenza season.

The most efficient method of preventing annual influenza epidemics is through pre-exposure vaccination and many of these illnesses and deaths are preventable. The medical community has nearly unanimously embraced the recommendation by the Association for Professionals in Infection Control and Epidemiology (APIC) and the Centers for Disease Control and Prevention (CDC) on the safety and efficacy of immunization in reducing influenza rates.

The influenza vaccination is safe. According to the World Health Organization Information Sheet on the Influenza Vaccine (July 2012) the most common side-effect is a local reaction of soreness at the vaccination site affecting 10% - 64% of vaccines and usually resolves in two days or less.

Despite making this available and easily accessible to health care workers, Hawai'i continues to have a low reported rate of vaccinated health care workers. Given the contact health care workers have with the most physically compromised – our patients – it would be good public policy to require this for all individuals with indirect or direct patient contact.

In an influenza A, outbreak in a neonatal intensive care unit in 1998, 19 of the 54 patients on the ward tested positive for influenza A. Of these 19, six were symptomatic and one died. In a

survey of the 150 medical staff involved during the outbreak, only 15% had received the influenza vaccination including 67% of physicians and 9% of nurses. Only 29% of staff with symptomatic influenza took time off from work. (Cunney, Bialachowski, Thornley, Smaill, & Pennie, 2000).

Another outbreak the same year in another bone marrow transplant unit illustrates the devastation that a hospital outbreak can have on its most vulnerable patients. Of the 25 confirmed cases of nosocomial pneumonia in the hospital, 40% were in the BMT ward, two of which died [21]. Surveys during this outbreak revealed a 12% vaccination rate among health care workers on the unit. The following influenza season, despite of an aggressive eight-pronged, but voluntary education program, 42% of health care workers on the bone marrow transplant unit still failed to receive influenza vaccine. (Weinstock, et al., 2000)

A Scottish study compared mortality rates between long-term care hospitals that offered influenza vaccination to health care workers, where 51% were vaccinated, and hospitals that did not, where only 5% were vaccinated [7]. The result was nearly a 40% reduction in all-cause mortality among the patients cared for by the health care workers in the hospitals with higher levels of health care worker influenza vaccination. (Carman, et al., 2000)

“Nichol et al. reported that healthy working adults who receive influenza vaccination have 25% fewer upper respiratory infections, 44% fewer doctor visits, and 43% fewer sick days off, saving an average of \$47 per person annually. A previous study by Nichol et al. revealed that among three different cohorts of 25,000 adults each studied over 3 years, influenza vaccination reduced pneumonia and influenza hospitalizations by 48–57%, all acute and chronic respiratory conditions by 27–39%, and all-cause mortality by 39–54%. This resulted in a direct savings per year averaging \$117 per person immunized.” (Poland, Tosh, & Jacobson, 2005)

Mandatory vaccination programs help health care personnel carry out their professional duty to provide care to all patients without the threat of undue harm caused by influenza transmission.

We ask that you pass SB 2394.

Thank you for the opportunity to testify.

From: Kenneth Nakamura, MD
Chief Medical Officer Kapi'olani Medical Specialists
Chair, Department of Pediatrics

Re: **Testimony in Support**
SB 2394, Relating to Influenza Immunization

My name is Kenneth Nakamura, MD. I am a Pediatrician and Chief Medical Officer of Kapi'olani Medical Specialists (KMS) and Chair of the Department of Pediatrics. Kapi'olani Medical Specialists is a specialty physician group committed to providing health care needs for Hawai'i's women and children. Kapi'olani Medical Specialists partners with Kapi'olani Medical Center for Women & Children to provide pediatric and women's specialty care. The group also partners with the University of Hawai'i John A. Burns School of Medicine in research, education and training.

KMS is writing in **strong support** of SB 2394 which would require annual influenza vaccinations for health care workers in hospitals who have contact with patients.

Every year in the United States, anywhere from 5% to 20% of the population contracts influenza every year and more than 200,000 people are hospitalized from seasonal flu-related complications. The most efficient method of preventing exposure to influenza is through pre-exposure vaccination.

The Association for Professionals in Infection Control and Epidemiology (APIC), the Centers for Disease Control and Prevention (CDC) and other national healthcare organizations have all recommended the efficacy of mandatory health care worker vaccination to reduce the incidence of influenza exposure. Mandatory vaccination programs help health care personnel carry out their professional duty to provide care to all patients and circumvent the risk of inadvertent influenza transmission to patients. For pregnant mothers and babies, the exposure to influenza is additionally concerning.

It is sound public policy to require all health care workers who have direct or indirect contact with patients – especially in birthing centers - take all necessary and reasonable precautions to keep them safe and minimize harm.

Thank you for the opportunity to testify. We ask that you pass SB 2394.

From: Marian Melish, MD

Re: **Testimony in Support**
SB 2394, Relating to Influenza Immunization

My name is Marian Melish, MD. I am an infectious disease specialist at Kapi'olani Medical Center and fellow of the American Academy of Pediatrics (AAP). Kapi'olani Medical Center is the state's only maternity, newborn and pediatric specialty hospital with 207 beds and 66 bassinets. Kapi'olani is also a tertiary care, medical teaching and research facility. The not-for-profit hospital is an affiliate of Hawai'i Pacific Health.

I am writing in **strong support** of SB 2394 which would require annual influenza vaccinations for health care workers in hospitals who have contact with patients.

In Hawai'i, according to the CDC, the health care worker vaccination level ranks among the bottom 10% for the entire nation. In spite of recommendations by national organization such as the Association for Professionals in Infection Control and Epidemiology (APIC), the Centers for Disease Control and Prevention (CDC) the response to voluntary programs has failed to increase immunization rates to acceptable levels required to substantially reduce healthcare-acquired influenza.

In the United States, anywhere from 5% to 20% of the population contracts influenza every year and more than 200,000 people are hospitalized from seasonal flu-related complications. The most efficient method of preventing exposure to influenza is through pre-exposure vaccination. The CDC estimates that influenza vaccination prevented approximately 7.2 million illnesses, 3.1 million medically attended illnesses, and 90,000 hospitalizations associated with influenza in the 2013-14 influenza season.

It is widely accepted that mandatory vaccination programs are effective in reducing the risk of inadvertent transmission of influenza. Requiring that all health care professionals be required to take this precaution would be good public policy.

Thank you for the opportunity to testify.

February 3, 2016

LATE

I understand a set of bills have been introduced (HB 1946/SB 2393, HB 1910/SB 2316, HB 1945/SB 2394, and HB 1722) that would **severely restrict freedom of choice** when it comes to vaccination.

Specifically:

- HB 1946 and SB 2393 would require that the state director of health implement rules for vaccine requirements, as they are recommended by the Advisory Committee on Immunization Practices, but do so without any public input.
- HB 1910 and SB 2316 would mandate that all students entering 7th grade in Hawaii receive at least one dose of the HPV (human papillomavirus) vaccine.
- HB 1945 and SB 2394 would mandate health care workers receive a yearly flu vaccine.
- HB 1722 would eliminate the religious belief exemption to vaccination for public school students.

These bills raise a number of concerns for parents, children, and people in general.

Parents have a right to make their own decisions about treatments for their children based on informed consent. Limiting an individual's ability to make informed decisions about what gets put into their body **violates medical ethics and basic personal freedoms**.

I know that the vaccination question is a hotly debated topic, even in the medical community. Many parents are concerned that some vaccines are unsafe because they may contain harmful ingredients like mercury or aluminum. A study published in Current Medical Chemistry in 2011 stated that the "continued use of aluminum adjuvants in various vaccines for children as well as the general public may be of significant concern" because "aluminum presented in this form carries a risk for autoimmunity, long-term brain inflammation and associated neurological complications and may thus have profound and widespread adverse health consequences."

The pharmaceutical companies themselves have acknowledged the dangers of their products. One of the fathers of Merck's vaccine program warned the company that six month olds would suffer dangerous exposure to mercury after being vaccinated. Eli Lilly conducted studies which concluded that thimerosal, the vaccine preservative that contains mercury, was toxic in concentrations as low as one part per million, which is 100 times weaker than the concentration found in some flu vaccines.

To force **anyone** to expose themselves to such risks is unethical.

In addition, others believe the overloading of a young immune system with so many vaccines at once causes genetic changes. Some generally support vaccinations but wish there were more scientific clarity.

However, I think we all can agree that we need to keep information clear, unambiguous, and uncensored, and to **allow people to make informed choices for themselves and their families**--especially when so much information and evidence exists of the possible dangers posed by some vaccines.

Current law protects both my family's health and our right to make our own healthcare choices, and I call upon you to **oppose any legislation that would restrict my, and my family's, freedom of choice when it comes to vaccination.**

Comments: Where is our choice in this matter? Naturally health care workers should take universal precaution such as wearing masks, gloves etc. But when you force workers to take a vaccination with very low effectiveness rates it is an invasive and oppressive action. What happened to Informed consent and our right to dissent certain medical procedures. I don't take the flu shot, because, I believe the risk outweighs the benefits greatly. This is my choice to make, not yours.

Comments: What I put into my body should be a choice. I choose live a healthy lifestyle and do not vaccinate or put other toxins into my body due to the adverse effects that it causes. The toxic ingredients that they put into vaccines cause significant dangers in people and can even result in death. How can this be mandated? You won't drug test welfare recipients, because it is a violation of their rights, but you will make it mandatory to get these vaccines?

SB2394

Submitted on: 2/3/2016

Testimony for CPH on Feb 4, 2016 09:00AM in Conference Room 229

Submitted By	Organization	Testifier Position	Present at Hearing
Skye Coe	Individual	Oppose	No

Comments: I OPPOSE SB2394 (Please read below carefully) because *The flu vaccine is not effective. Effectiveness rates are about 11-23%. *The choices for flu vaccination are an injection that has the toxic preservative thimerosal or a live virus nasal spray. - Thimerosal breaks down into ethylmercury in the body and is found in brains in animal research. - If you've opted for the live virus nasal spray you are supposed to not have a compromised immune system or be around others with compromised immune systems (perhaps not the best idea for our healthcare workers?!?). Pregnant women are also not allowed to get the nasal spray and are therefore subjected to being injected with the thimerosal-laden injection, which has NOT been tested for safety in pregnant women and could very well adversely affect the fetus. *Many report that the flu vaccine actually causes illness post-injection. In fact, there are more than 104,465 adverse reactions, hospitalizations (9,037), injuries, disabilities (2,003) and deaths (1,115) reported to the Vaccine Adverse Events Reporting System (VAERS). *If there is an adverse event, the individual is responsible for proving the injury, has to pay \$400 to file a complaint and has to hire a lawyer to defend them. The maker of the vaccine is not held liable and cannot be sued for any injury that might occur. *Vaccination is linked to a number of adverse health outcomes including: acute encephalopathy, anaphylaxis, Guillain Barre Syndrome, acute and chronic arthritis, smallpox, polio, measles and varicella zoster vaccine strain infections (i.e. getting the illness that you were vaccinated against; can also be a carrier of these infections and spread to others), chronic nervous system dysfunction, febrile seizures, brachial neuritis, thrombocytopenia, shock, syncope, and even death. There is also some evidence that vaccinations could be linked to the following: asthma, allergies, autism, communication disorders, intellectual disability, disruptive behavior disorder, seizures, epilepsy, autoimmune disorders (e.g. POTS, MS, DM1, and many more), learning disorders, tics and Tourette's, ADHD, and more. *The bottom line is that there is NOT enough evidence to definitively state that vaccination is safe for everyone, and therefore individuals and parents should ALWAYS be able to CHOOSE with the advice of their OWN HEALTHCARE PROVIDERS. Respectfully, J. M. (Skye) Coe

Aloha,

LATE

I am sending you this message in regards to the recent proposed bill for Hawaii, SB2394, I am a father and uncle to many, and I am sincerely asking that you oppose these bills.

I feel that it is the right of a parent or legal guardian to raise children and make appropriate medical decisions for them. I also am aware of the uncertainty of the safety of vaccines, and the truth is that vaccines have not proven to be as effective as they claim to be.

This bill is a threat to the health & safety of our keiki, I urge you oppose it.

Thank you & God Bless you,

Edward Schiek

Submitted By	Organization	Testifier Position	Present at Hearing
Jessica McCormick	Individual	Oppose	No

Comments: The bill SB2394 should be OPPOSED by our legislators. Healthcare workers should not be required to get vaccinated in order to keep their position. Any medical procedure requires informed consent, and if there is any risk there should be a choice, even for healthcare workers. This vaccine has more reports of injury to the VAERS than any other vaccine. It has been documented as being very ineffective. The influenza vaccine is only effective less than 20% of the time. Also, the flu mist is a live virus vaccine, and a person who is vaccinated with it can be spreading the virus for up to a month after being inoculated. That means all of these healthcare workers will be spreading the vaccine to their patients, not protecting them. This bill should be strongly OPPOSED by all legislators!

Please note that testimony submitted less than 24 hours prior to the hearing, improperly identified, or directed to the incorrect office, may not be posted online or distributed to the committee prior to the convening of the public hearing.

Aloha,

LATE

I would like to ask the legislature to OPPOSE SB2394 to require health care workers to obtain the flu shot vaccination.

This is a clear and disturbing violation of our human rights, if someone does not want to obtain a vaccination, especially one they have never gotten before and have never had the flu or have other reasons not to obtain the vaccination, they should be able to without being punished or forced out of their job.

I vehemently oppose all bills that are coming through this session that require anyone to obtain a vaccination to attend school or keep their employment.

SB2394 - OPPOSE

To whom it may concern,

I unequivocally OPPOSE Bill SB2394. No law ever should dictate what a human can or will not inject into their body. Healthcare workers are inundated day in and day out with illness and disease for which no vaccines exist. Out of everyone in the world, medical professionals are equipped with the knowledge to make a rational, informed decision about what they would like to be vaccinated against or not. In no way should the state or any other individual's beliefs have an impact on someone else's health and wellbeing decisions.

This is not a decision for the state. It is embarrassing that it is even being debated. Political people deciding what a medical professional can inject into themselves? It sounds really insane and ridiculous when you write it down.

Comments: The flu vaccine has never been proven effective since it is created as a "best guess" several months in advance of the flu season. Frequently washing your hands with warm soap and water is very effective in preventing the flu and is quite affordable. Mandating another vaccine will negatively impact the healthcare force in which Hawaii cannot afford at this time.
