

# HAWAII STATE ENERGY OFFICE STATE OF HAWAII

DAVID Y. IGE  
GOVERNOR

SCOTT J. GLENN  
CHIEF ENERGY OFFICER

235 South Beretania Street, 5th Floor, Honolulu, Hawaii 96813  
Mailing Address: P.O. Box 2359, Honolulu, Hawaii 96804

Telephone: (808) 587-3807  
Fax: (808) 586-2536  
Web: [energy.hawaii.gov](http://energy.hawaii.gov)

Testimony of  
**SCOTT J. GLENN, Chief Energy Officer**

before the  
**HOUSE COMMITTEE ON ENERGY & ENVIRONMENTAL PROTECTION**

Tuesday, February 2, 2021  
8:30 AM  
State Capitol, Conference Room #325

Comments in consideration of  
**HB 556**  
**RELATING TO ENERGY EFFICIENCY.**

Chair Lowen Vice Chair Marten, and Members of the Committee, the Hawaii State Energy Office (HSEO) offers comments on HB 556 which would (1) require voting members to have experience in energy efficiency standards, and (2) require the counties to amend or adopt energy efficiency codes no later than one year after adoption of the Hawai'i state building energy conservation code.

The HSEO is in agreement with the provision in Section 2 of the bill that at least one voting member shall have expertise in building energy efficiency standards, and that at least one voting member shall have experience in sustainable building, design, construction, and operation. Such a requirement is quite similar to existing provisions in the current statutory language, and it is the HSEO's observation that such expertise exists within the current council's makeup.

Section 3 of the bill requires the counties to adopt their energy codes no later than a year following State Building Code Council adoption. Although the HSEO appreciates the intent, it raises the concern that the county building departments may be challenged with the tasks of gaining administration consensus, introducing legislation, serving as subject matter experts at public meetings and testifying before

county councils and committees until adoption is achieved, all within the one-year adoption cycle. HSEO defers to the counties on this matter.

For the Committee's information, the State Building Code Council adopted the 2018 International Energy Conservation Code (IECC) on December 15, 2020, and the HSEO will commence training shortly. The 2021 IECC was published in January, 2021 and the State Building Code Council will commence meetings on the 2021 IECC later this year. HSEO is contracting to provide training for the 2018 IECC and is preparing to convene a working group to support the State Building Code Council on developing Hawaii amendments to the 2021 IECC.

Finally, there appears to be a typographical error on page 6, line 19 of the bill, where it says "expect" rather than "except."

Thank you for the opportunity to testify.

HOUSE COMMITTEE ON ENERGY & ENVIRONMENTAL PROTECTION  
Tuesday, February 2, 2021 — 8:30 a.m.

**Ulupono Initiative supports HB 556, Relating to Energy Efficiency**

Dear Chair Lowen and Members of the Committee:

My name is Amy Hennessey, and I am the Senior Vice President of Communications & External Affairs at Ulupono Initiative. We are a Hawai'i-based impact investment firm that strives to improve our community's quality of life by creating more locally produced food; increasing affordable, clean, renewable energy and transportation options; and better managing freshwater and waste resources.

**Ulupono supports HB 556**, which requires that the State Building Code Council include voting members with experience and knowledge in building energy efficiency standards and sustainable building, design, construction, and operation. This bill also requires that the counties amend or adopt their respective building codes and standards based upon the International Energy Conservation Code no later than one year after the adoption of the Hawai'i state building energy conservation code.

Ulupono supports expanding the membership of the State Building Code Council to include voting members with experience and knowledge in building energy efficiencies and sustainability. Requiring the counties to adopt building codes in a timely manner following the State's lead is extremely important to align with the three-year national code update cycle. By maintaining a current building energy conservation code at both the State and county, Hawai'i is providing a more resilient future for our community.

Thank you for this opportunity to testify.

Respectfully,

Amy Hennessey, APR  
Senior Vice President, Communications & External Affairs

*Investing in a Sustainable Hawai'i*

## HOUSE COMMITTEE ON ENERGY & ENVIRONMENTAL PROTECTION

February 2, 2021, 8:30 A.M.

Video Conference

### TESTIMONY IN SUPPORT OF HB 556

Aloha Chair Lowen, Vice Chair Marten, and members of the Committee:

Blue Planet Foundation **supports HB 556**, which improves the process for updating energy conservation building codes in Hawai'i and ensures that energy efficiency and green building design, which can lower monthly financial burdens for residents and businesses while also lowering their carbon footprint, are not dismissed or overlooked in the process. This bill adopts two best practices from other jurisdictions that have led the way on energy-efficient building:

- (1) Requires that the state building code council (SBCC) include voting members with experience and knowledge in building energy efficiency standards and sustainable building, design, construction, and operation; and
- (2) Updates the overall timeline for amending or adopting building energy conservation codes to bring Hawai'i's code adoption process in alignment with the three-year national code update cycle.

States across the country, including California, Massachusetts, Vermont, and Oregon, have already incorporated these best practices into their building energy code adoption pathways. According to the American Council for an Energy-Efficient Economy's (ACEEE's) annual ranking of energy efficiency policies and programs, these are among the most energy efficient states in the country. For 2020, ACEEE ranked these states first, second, third, and ninth, respectively.<sup>1</sup> Hawai'i is ranked fourteenth, and HB 556 offers an opportunity for Hawai'i to move up in the ranks to the benefit of the state's residents and businesses, who pay the highest electricity rates in the nation.

### **Codes reduce energy consumption and lower utility bills**

---

Building codes have direct and indirect impacts on our wellbeing and quality of life. By establishing and regularly updating uniform state and county building codes, Hawai'i can ensure that building design, construction, and operation address society's most important concerns,

---

<sup>1</sup> See ACEEE State Energy Efficiency Scorecard, <https://www.aceee.org/state-policy/scorecard>.

including public health and safety, environmental protection, and consumer protection against costly monthly utility bills.

The primary function of energy codes is to reduce energy consumption in buildings, which reduces greenhouse gas emissions and pollution from burning fossil fuels. Energy codes can also lessen peak energy demand and reduce our reliance on imported energy sources, which increases utility system reliability and energy security, respectively. Moreover, energy codes create a more comfortable living and working environment through improved indoor air quality. They also help occupants save money by reducing energy bills, which stimulates the economy. For example, the anticipated energy savings arising from the 2015 International Energy Conservation Code (IECC) were calculated in a May 2016 report prepared for the State of Hawai'i Department of Business, Economic Development & Tourism to total over \$1.4 billion.<sup>2</sup>

## **Leading states require sustainability and green building expertise**

House Bill 556 adopts the best practice seen in other states of requiring energy conservation and sustainability expertise on the council, committee, or commission responsible for reviewing code updates.

The SBCC in Hawai'i oversees the adoption of various portions of the state's building codes, including the energy code. Because the SBCC oversees a such broad range of building codes, the energy conservation code is often lower on the council's priority list for adoption. Further, although one spot on the SBCC is reserved for a representative from the State Energy Office, there is no explicit statutory requirement—as there is in other states—that council members have experience in building energy efficiency standards or sustainable building design. Thankfully, the current SBCC composition includes at least one member with such expertise, but that may not always be the case. The expertise specified in HB 556 can help ensure that energy is not relegated to a last-place priority among the SBCC's other building code matters and avoid knowledge gaps in future council compositions.

Other states make energy expertise explicit. In California, for example, primary responsibility for updating energy codes is delegated to the Energy Commission. This commission includes mandatory expertise in energy systems, environmental protection, and natural resource management. The code-update process is broadly overseen by the Building Standards Commission, which must include at least one member experienced with energy efficiency standards, and at least one member with experience in sustainable building, design, construction, and operation. Similar energy and energy conservation expertise requirements are in place in Oregon, Massachusetts, and Vermont.

## Hawai'i lags behind other states in adopting building energy codes

---

States across the country use these national model codes and standards as a starting place for adopting state-specific versions based on their unique characteristics and climates. Like other states, Hawai'i develops its building energy code based upon the IECC. A governing body—the International Code Council—produces an updated version of the IECC through a democratic and deliberative process every three years. As noted by the Environmental and Energy Study Institute, “[t]he process of updating model codes every three years is optimal to ensure new technologies, materials and methods, as well as better approaches to health and safety, can be incorporated into the next generation of buildings with sufficient time for proof of performance.”<sup>3</sup>

Hawai'i, however, has historically operated on a much slower timeline. The most recent version adopted by the state was the 2015 IECC, which replaced the 2006 IECC that was in effect at the time the 2015 version was adopted. In Hawai'i, adoption of the state building code is just the first step—it must subsequently be adopted by all four counties. The adoption at the county level has lagged even further. For example, the City and County of Honolulu did not formally update its modified version of the 2015 IECC until June 2020.

This lag is, in fact, embedded in the building code statute itself. By statute, the Hawai'i state building energy conservation code must be adopted by the SBCC within two years of the publication date of the national model code. Then, the state code must be adopted by the counties within two years following the SBCC's adoption. In essence, this timing translates to a statutory framework in which counties are required to amend or adopt their county building codes within four years of the publication date of the model code. This four-year timeframe in statute keeps Hawai'i lagging behind the national and other states' code update cycles (See Figure 1 below for a comparison of update cycles in various jurisdictions).

House Bill 556 remedies this faulty timeline by ensuring the entire update cycle—from national publication to county adoption—does not exceed three years (i.e. the same frequency as national code updates). Mirroring the national code update cycle will ensure that construction in Hawai'i—and the buildings that will remain in our building stock for decades to come—can keep pace with changing technology and the state's clean energy and climate goals.

## Conclusion

---

Most individuals spend a majority of their lives inside buildings. Yet buildings are often overlooked as important levers for influencing our safety, health, and economic and environmental quality of life. Not only can high-performing buildings lead to lower monthly utility bills, energy efficiency is also the cheapest, quickest, and cleanest way to accelerate the transition to 100% renewable energy.

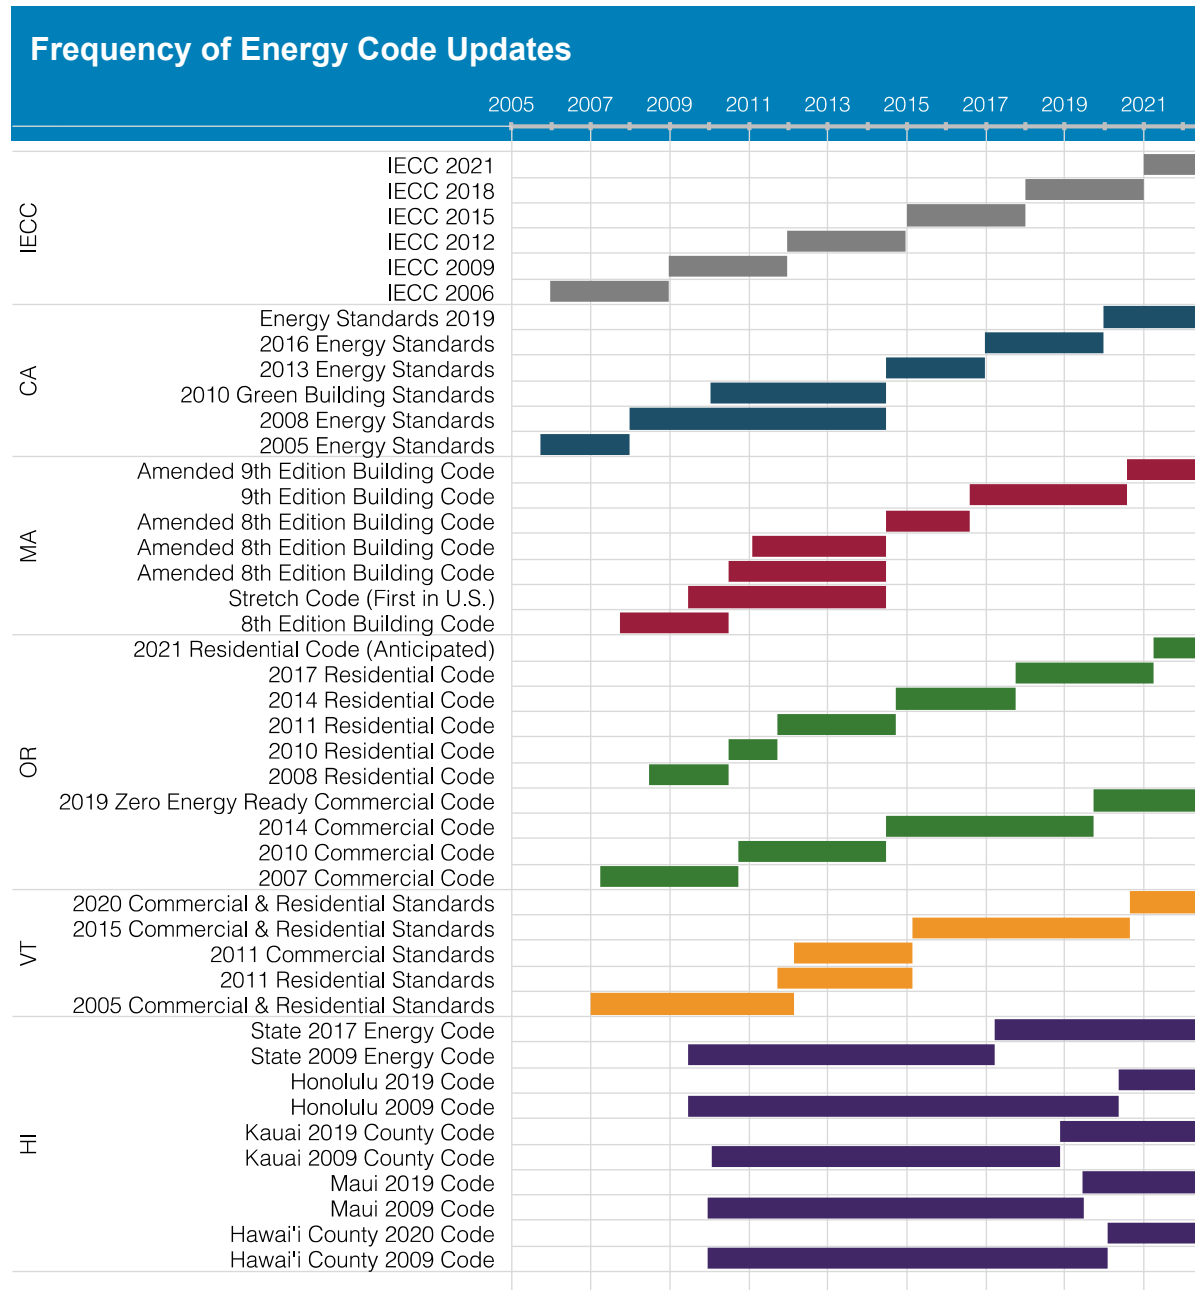

---

<sup>3</sup> Vaughn, Ellen and Jim Turner, *The Value and Impact of Building Codes*, 2013, <https://www.eesi.org/files/Value-and-Impact-of-Building-Codes.pdf>.

House Bill 556 helps to ensure that we are building for the future, not the past. Improving the process for updating building energy codes should be part of Hawai'i's journey to rebuild better in response to the COVID-19 pandemic.

We respectfully request that the Committee forward HB 556. Thank you for the opportunity to provide testimony.

From: Climate Protectors Coalition (by Ted Bohlen)

Hearing Date: Tuesday, February 2, 2021, 8:30 am

**In support of HB556**

Aloha Chair Lowen, Vice Chair Marten, and Energy and Environmental Protection Committee members:

The Climate Protectors Coalition **supports HB556.**

The Climate Protectors Coalition is a group inspired by the Mauna Kea Protectors but focused on reversing the climate crisis. As a tropical island State, Hawaii will be among the first places harmed by the global climate crisis, with more intense storms, loss of protective coral reefs, food insecurity, and rising sea levels destroying our shorelines. We must do all we can to reduce our carbon footprint and become at least carbon neutral as soon as possible. The planet faces an existential climate crisis and we must act now! Scientists have made clear that we are part of the last generation that can stop or at least mitigate the devastating impacts of climate change. If we are to solve the climate crisis, it will require **all of us** working together. Hawaii can and should be a leader in showing the world the way forward towards a safe and sustainable climate and future. The sooner we inspire others to take action and lead by example, the better off the future will be for our children.

Making building codes more energy efficient is an excellent way to reduce energy use and concomitant greenhouse gas emissions. Because decisions made by consumers and builders on buildings last a long time, the potential for savings is very large. Hawaii has not kept up as well as other states in updating its building conservation codes, and Hawaii's counties have lagged even further behind. Given the very high cost of electric power in Hawaii and our position at the forefront of the impending climate crisis, it is imperative that our State Building Code Council have voting members with experience and knowledge in energy efficiency standards and sustainable building, design,

construction and operation. The requirement that the State conservation code shall become effective on an interim basis in counties that fail to amend their codes within a year after the State or is also an excellent idea.

Please pass this bill!

Mahalo for the opportunity to testify in **support** of this very important legislation.

Climate Protectors Coalition (by Ted Bohlen)
