Comments:

How much longer are we going to study the study of a study? It's time to either get into action, or get out of your position to let the next candidate do something about it. What are you studying? Yes, Hawai'i has enough sunshine for solar. Yes, solar panels can go on top of roofs, can become carports, can be utilized on the top level of parking structures - where nobody parks, and can be used to replace pavilion roofs in sunny places.

Yes, it will drastically reduce all of the current negative externalities of our current electric system.

Yes, it is costly upfront.

Yes, the utility bills as we know it will change.

Instead of paying for supplies needed in our current energy system, people will be charged a slightly smaller bill and those payments will be allocated to the costs of implementation. The fact that the bill is actually a little smaller will encourage people in the lower middles and lower class to actually try harder to pay their own bills, and will reduce public monies that are currently spent on assistance.

Implement the more sustainable power sources on Moloka'i and Lana'i first. Why? It's cheaper to start small and observe a smaller population data. It streamlines our technicians to fill vacancies where the old power system is still intact, while opening new professional and educational opportunities where jobs are limited. It will revivie those populations, while efforts are continued in other areas, as the area becomes available. Then, you phase into the urban areas last because they will be the most costly, and you will want to have a stronger power supply prior to responding to demand in those areas. What else do yyou have to study? Those of us who are engaged in sustainability and at the college have already done these studies. Perhaps you should hold a congressional session looking up the research that was already done within a relevant timeframe. I'll help you: <https://scholar.google.com>
