**In consideration of
SENATE CONCURRENT RESOLUTION 122 / SENATE RESOLUTION 104
REQUESTING THE DEPARTMENT OF LAND AND NATURAL RESOURCES TO
WORK WITH THE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION
AND OTHER EXPERTS TO CONDUCT A STUDY ON THE POPULATION STATUS
OF DEPLETED CORAL REEF HERBIVORES AROUND THE ISLAND OF O'AHU
AND DEVELOP EFFECTIVE ALTERNATIVE POLICIES FOR SUBSTANTIALLY
REPLENISHING THOSE POPULATIONS WITHIN A DECADE**

Senate Concurrent Resolution 122 / Senate Resolution 104 request the Department of Land and Natural Resources (Department) to work with the National Oceanic and Atmospheric Administration (NOAA) and other experts to conduct a study on the population status of depleted coral reef herbivores around the island of O'ahu and develop effective alternative policies for substantially replenishing those populations within a decade. **The Department supports these measures and offers the following comments.**

The Department recognizes the importance of herbivorous reef fish for both the health of coral reef ecosystems as well as sustainable non-commercial and commercial fisheries. It is the responsibility of the Department to find a balance between ecosystem health and continued access to sustainable fisheries through effective management informed by public input. The Department would welcome a collaboration with NOAA to conduct a study on the population status of various herbivore fish species around the island of O'ahu. The Department lacks positions and staff with the level of expertise to independently conduct formal stock assessments and could use additional assistance from our federal partners.

In response to mounting scientific evidence and community concerns regarding the sustainability of many herbivorous reef fish, the Department's Division of Aquatic Resources (DAR) led a multi-year statewide stakeholder engagement process to develop conservation measures for these important species. As a result of this process, the Board of Land and Natural Resources recently approved amendments to statewide herbivore rules, including restrictions on both commercial and non-commercial take. The Department will continue to monitor the health of statewide herbivore populations to gauge the effectiveness of these new regulations.

Additionally, through the Holomua Marine Initiative, the Department is facilitating a community-led process to identify island-scale fisheries issues and establish island- and place-based management measures reflecting varying resource conditions and cultural practices. This process, which involves input from fishers and other affected stakeholders, could help identify policies and strategies to substantially increase coral reef herbivore populations around O'ahu.

Mahalo for the opportunity to provide testimony in support of these measures.

To: The Honorable Chair Lorraine Inouye, Vice-chair Brandon Elefante, and members of the Committee on Water and Land

From: Hawai'i Reef and Ocean Coalition (by Ted Bohlen)

Re: Hearing SCR122/SR104 REQUESTING THE DEPARTMENT OF LAND AND NATURAL RESOURCES TO WORK WITH THE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION AND OTHER EXPERTS TO CONDUCT A STUDY ON THE POPULATION STATUS OF CORAL REEF HERBIVORES AROUND THE ISLAND OF OAHU AND DEVELOP EFFECTIVE POLICIES FOR SUBSTANTIALLY INCREASING THOSE POPULATIONS WITHIN A DECADE.

Hearing: Monday, March 25, 2024, 1:00 p.m. CR229

Aloha Chair Inouye, Vice-chair Elefante, and members of the Committee on Water and Land:

The Hawai'i Reef and Ocean Coalition (HIROC) is a group of scientists, educators, filmmakers and environmental advocates who have been working since 2017 to protect Hawaii's coral reefs and ocean.

**The Hawai'i Reef and Ocean Coalition STRONGLY SUPPORTS
SCR122/SR104!**

To remain healthy and resist climate stresses, coral reefs require abundant and diverse herbivores, which are fishes that eat seaweeds, such as parrotfishes (uhu), surgeonfishes (e.g., kala, kole, manini), and chubs (nenuue). A diverse population of these fish keep reef surfaces clean so that corals can flourish. The depletion of herbivores, especially in the presence of wastewater nutrients, results in reefs being dominated by seaweeds rather than corals, thus reducing fishing and other recreational, commercial, and traditional cultural opportunities.

The population of coral reef herbivores around Oahu is the lowest in the State, existing at below five percent of its potential. Ever-increasing ocean warming has caused coral bleaching events that kill corals and are predicted to occur every year in Hawai'i before the year 2040.

To help Oahu's coral reefs survive, this concurrent resolution **asks the Department of Land and Natural Resources** to:

(1) Work with the National Oceanic and Atmospheric Administration Pacific Islands Fisheries Science Center and other experts to **conduct a study on the population status of individual species and families of coral reef herbivores around Oahu, prioritizing uhu and kala**; and

(2) Conduct an analysis of policies and strategies to substantially increase the populations of coral reef herbivores around Oahu within a decade.

Please help coral reefs by approving this concurrent resolution!

Mahalo!

Hawai'i Reef and Ocean Coalition (by Ted Bohlen)

**Testimony of The Nature Conservancy
Support for SCR 122
Committee on Water and Land
March 25, 2024, 1:00 p.m.
Conference Room 229 & Videoconference**

Aloha Chair Inouye, Vice Chair Elefante, and Members of the Committee:

The Nature Conservancy (TNC) **supports** SCR 122, requesting the Department of Land and Natural Resources to work with the National Oceanic and Atmospheric Administration and other experts to conduct a study on the population status of coral reef herbivores around the island of O'ahu and develop effective policies for substantially increasing those populations within the decade.

Ensuring that reefs have healthy herbivore populations, including uhu populations, is one of the most important and effective actions we can take to make reefs as resilient as possible in a changing world. Many stressors can kill corals and lead to the loss of the habitat they create, and the ability of reefs to recover from damage depends on the presence of an abundant, diverse population of herbivores that can keep seaweed populations in check, keeping reef area clear for new corals to settle and grow. Studies from around the world have demonstrated that resilience and recovery is enhanced by healthy herbivore populations. Recent research in Hawai'i has reinforced this finding, with a statewide analysis showing that reefs in West Hawai'i that had abundant herbivores recovering more quickly from the impacts of the 2015 mass coral bleaching.

There is very strong evidence, however, that herbivore populations in Hawai'i are depleted. Communities across the state have voiced concerns that many species of herbivores are not as abundant as they used to be, and in-water surveys conducted by many organizations across the state show that herbivore populations in many areas are far below what could and should be present on those reefs. A just-released statewide analysis revealed that in many places, especially where herbivore abundance is low, fishing-driven reductions in herbivore populations have led to less healthy reefs. A stock assessment conducted by fisheries scientists from the National Oceanic and Atmospheric Administration found that both the surgeonfish kala and **parrotfish uhu palukaluka**, are experiencing overfishing (i.e., fish are being removed faster than they are replenished).

All herbivores are important for the health of the reef, but **uhu palukaluka is the single most important species in Hawai'i** for scraping the reef free of all algae and other coral-competitors so that new corals can settle and grow to repair reefs.

RE: Comments on SCR122/SR104 Relating to Herbivores

Dear Chair Inouye and Members of the Committee on Water & Land,

For the Fishes, a Maui-based non-profit organization dedicated to the protection of coral reef wildlife, thanks the Committee for the opportunity to provide comments.

Research has shown the importance of healthy and abundant populations of coral reef fishes, notably herbivores, for their role in combatting the impacts of climate change, and specifically in controlling the overgrowth of algae that threatens to smother our reefs that leads to coral loss and death.

A recent study, below (Grabowsky & Thornhill, 2020), showed that **populations of the top herbivorous species taken by the aquarium pet trade on Oahu declined by more than 90 percent.** In West Hawaii (below), the top species collected by the aquarium trade, the yellow tang (lau'ipala) showed annual declines of 60 percent due to their extraction by the trade. Fortunately, research has shown that closing areas and/or prohibiting the take of species is successful. Following the closure of the aquarium trade in West Hawaii in 2018, yellow tang populations increased by millions.

Scientists forecast that ocean heat waves will only increase in frequency and intensity over the coming years, threatening to wipe out nearly 70 percent of our coral reefs as early as 2030. We must take any and all actions to protect our coral reefs now. Our reefs cannot wait 10 years. Herein is the challenge we are facing—it is not the lack of scientific data but the lack of political will and leadership to take the long- needed and known actions necessary to protect our coral reefs.

Thank you for your consideration of these comments.

Inga Gibson

Scientific Testimony in Support of Resolutions
[HR69](#), [HCR83](#), [SR104](#), [SCR122](#)
Relating to Coral Reef Herbivores of the Island of O‘ahu

Dr. Mark Hixon (Professor, University of Hawai‘i at Mānoa, School of Life Sciences)

Dr. Alan Friedlander (Chief Scientist, Pristine Seas, National Geographic Society, and University of Hawai‘i Institute of Marine Biology)

Dr. Randy Kosaki (Marine Ecologist, NOAA, Papahānaumokuākea Marine National Monument)

Dr. Kawika Winter (Director, He‘eia National Estuarine Research Reserve, and University of Hawai‘i Institute of Marine Biology)

testifying as private citizens

Aloha Hawai‘i State Legislators hearing these resolutions:

We marine scientists with long experience studying coral reef herbivores in Hawai‘i, especially on O‘ahu, strongly support House Resolutions HR69 and HCR83 and Senate Resolutions SR104 and SCR122. The scientific evidence is overwhelming that herbivores are severely depleted around O‘ahu, and that strong remedial action must be taken very soon if our living-coral reefs are to survive.

Coral reefs provide extremely valuable ecosystem goods and services for the people of Hawai‘i, including habitat for nearshore fisheries, opportunities for tourism and other industries and activities, sand production for our beaches, and coastal protection from waves, storms, and erosion as sea level rises.¹ Reefs are also fundamental to the fabric of local communities, providing a source of food, materials, and cultural activities.¹ From a purely economic perspective, Hawai‘i’s coral reefs generate about \$800 million per year in gross revenues.² One estimate of the total economic value of coral reefs in the main Hawaiian Islands is nearly \$34 billion.³

Hawai‘i’s coral reefs, especially on O‘ahu, have suffered tremendously from increasing population density and coastal development, resulting in damage by snorkelers and divers, anchor drags and vessel groundings, runoff and leaching of sediment and fertilizers from poor land use practices, urban runoff and leaching of cesspool sewage and other pollutants, plastic debris, invasive species, and overfishing near population centers.⁴ More recently, ever-increasing ocean warming has caused coral bleaching events that have killed over 50% of the corals on some reefs.¹ **Ocean climate models predict that Hawai‘i’s coral reefs will bleach every year starting sometime between 2040 and 2045 (Fig. 1).**⁵

Maintenance and recovery of coral reefs requires abundant and diverse herbivores, which are fishes and invertebrates that eat seaweeds (technically, benthic algae).⁶ Herbivores prevent seaweeds from outcompeting and replacing corals, especially following coral mortality events.⁶ Where herbivores are depleted, seaweeds eventually proliferate, which prevents reef recovery and eventually resulting in coral death.⁶ The major herbivores that clean dead reef surfaces so corals can flourish are parrotfishes (uhu), surgeonfishes (kala, kole, manini, and others), and chubs (nenuue or enenuue).⁷

Building on previous studies,⁸ a recent peer-reviewed publication by Donovan et al. (2023)⁹ documented that **herbivore abundance in all moku around O‘ahu is not only the lowest in the state, but also less than 5% of its potential compared to relatively unexploited Kaho‘olawe (Fig. 2)**. The Division of Aquatic Resources (DAR) considers the status of both parrotfishes and surgeonfishes in Hawai‘i to be “unsustainable”.¹⁰ **The depletion of herbivores leaves Hawai‘i’s coral reefs extremely vulnerable to severe degradation because once coral dies and seaweeds cover a reef, corals cannot recover.**¹¹

A major contributor to herbivore depletion is illegal or otherwise unethical spearing of these fish at night, especially parrotfishes while these fish sleep helplessly under reef ledges, and especially around O‘ahu (Fig. 3).¹² Legal and otherwise ethical (pono) fishing of herbivores occurs during the day by subsistence, recreational, and commercial fisheries.¹⁰

Management agencies have long been concerned about herbivore depletion.¹³ DAR proposed a substantial package of herbivore fishing rules in December 2022.¹⁴ By the time the final rules package was passed by the Board of Land and Natural Resources in December 2023,¹⁵ **explicit protections of uhu and kala had been weakened to point where we believe these new rules will be ineffective, especially around O‘ahu. Importantly, the new rules do not address the sale of fish from successful poaching and pillaging, which the Division of Conservation and Resources Enforcement (DOCARE) reports is widespread at night around O‘ahu.**¹²

House Resolutions HR69 and HCR83 and Senate Resolutions SR104 and SCR104 are positive steps toward saving the coral reefs of O‘ahu and eventually other islands by encouraging action to increase the abundance of herbivores before coral bleaching becomes an annual event, predicted between 2040 and 2045.⁵ Note that past studies have shown it takes decades to recover severely depleted populations of coral reef fishes, including in Hawai‘i.¹⁶ Fortunately, O‘ahu’s coral reefs have high recovery potential.¹⁷ **Unfortunately, if we do not act soon, we believe that O‘ahu will lose most of our living-coral reefs in the coming decades.**

Aloha,

Yes to; REQUESTING THE DEPARTMENT OF LAND AND NATURAL RESOURCES TO WORK WITH THE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION AND OTHER EXPERTS TO CONDUCT A STUDY ON THE POPULATION STATUS OF DEPLETED CORAL REEF HERBIVORES AROUND THE ISLAND OF OAHU AND DEVELOP EFFECTIVE ALTERNATIVE POLICIES FOR SUBSTANTIALLY REPLENISHING THOSE POPULATIONS WITHIN A DECADE.

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature

Aloha Legislators,

I strongly support Senate resolutions SR104/SCR122 and nearly identical House resolutions HR69/HCR83 to address overfishing of herbivorous reef fishes on O'ahu.

I am submitting this testimony as a private citizen, but I bring my expertise as a professor of marine science and expert in coral reef ecology, fisheries, and resource management. I have been studying Hawai'i reefs and fisheries for over 15 years, and I have recently led a large comprehensive study of herbivore populations statewide (Donovan et al. 2023 *Transactions of the Royal Society B*). Below are a few relevant points from this study related to the resolution as proposed:

- We created a comprehensive database of >20k reef surveys, and 28 statewide maps/datasets of factors that influence reef condition (e.g., waves, pollution, fishing, etc), so the amount of data underlying our study is unprecedented and represents the best available information for understanding herbivore biomass and its relation to reef condition statewide.
- We found that herbivore biomass varies greatly across Hawai'i. Biomass is relatively high in remote areas such as Ni'ihau and Kaho'olawe. In contrast, **many areas have comparatively low biomass, especially around O'ahu.**
- While multiple drivers are at play, fishing is playing a major role in determining herbivore abundance. Because biomass conditions vary so drastically, the outcomes of management actions will depend on the extent of depletion. On O'ahu, biomass is very low so it will **require more drastic actions** to allow for recovery compared to areas where biomass is currently high and more modest actions will contribute to maintaining those populations as they are.
- Herbivores play a key role in maintaining reef resilience, so low biomass of herbivores not only means we do not have enough fish to catch and feed our families, but that ecosystem integrity is also compromised. On O'ahu this is especially evident as **we detected that herbivores have been reduced by fishing to levels that are too low to maintain ecosystem function on >80% of O'ahu reefs.**

In summary, we have ample evidence to support improved fisheries management of herbivorous fishes on O'ahu. With the reefs of O'ahu already in a compromised condition, and the increasing impacts mounting from climate change, there is very little time left to take action to restore ecosystem function and give our reefs a fighting chance.

Please do not hesitate to contact me if I can provide any further information.

Mahalo,
Dr. Mary Donovan

Senate Committee on Water and Land

SENATE CONCURRENT RESOLUTION 122 – WORKING GROUP ON STREAM MAINTENANCE

Position: **Strong Support**

Me ke Aloha, Chair Inouye, Vice-Chair Elefante, and Members of the Senate Committee on Water and Land.

SCR122 proposes that DLNR Aquatics work with the Pacific Islands Fisheries Science Center (NOAA) and others to study and recommend policies to replenish reef herbivores such as *uhu* and *kala*.

O'ahu is suffering the greatest depletion of these herbivores, which graze on algae to keep the reef corals protected. Some of these herbivores are easy prey for night spear-fishing, as they sleep during the night. Without their grazing services, however, our reefs are getting overrun and smothered. O'ahu has the greatest number of local fishermen, with keen interest in these fish. To protect the reefs, more needs to be understood about this predicament, to recommend policies to reasonably satisfy demand for fish while maintaining sufficient healthy herbivore populations to protect the future.

Without healthy reefs, the islands are susceptible to storm conditions, and collapse of the reefs poses ensuing damage to coastal lands. Reefs are already under stress from ocean warming and other invasive species, so a thorough understanding of the risks and opportunities, and the shaping of adaptation, are needed now.

Please support this timely call for maximizing cooperation and collaboration among the stewards of our susceptible reefs and the all-important status of reefs as nurseries for important dietary provisions for islanders.

Mahalo for the opportunity to address this issue,
/s/ Charley Ice

Planner, Department of Hawaiian Home Lands and liaison to the Water Commission (10 years) and Hydrologist, Commission on Water Resource Management (25 years) (retired)

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature

Aloha Legislators,

I strongly support House Resolutions HR69/HCR83 and Senate Resolutions SR104/SCR122 for desperately needed assistance in replenishing herbivorous fishes on O'ahu's coral reefs. The herbivorous fishes on the reefs of O'ahu, as on reefs of the other Hawaiian Islands, are mostly parrotfishes (*uhu*), surgeonfishes (like *kala*, *kole*, *manini*), and chubs (*nenue*). These fishes clean reef surfaces, preventing seaweeds from smothering corals. Although fished-down throughout our islands, they are most depleted on O'ahu. Recent scientific research has shown that the abundance of these fishes around the island of O'ahu is less than 5% its potential (Donovan et al. 2023 *Transactions of the Royal Society B*). Many reefs around O'ahu are already degraded from poor land management practices, coral bleaching from warm water episodes in recent years, and the ever-warming ocean is predicted to cause coral bleaching and death every year by 2040 (van Hooidonk et al. 2016 *Scientific Reports*). Measures of herbivore protection are desperately needed on O'ahu. Please pass these resolution so that Hawai'i can take steps to replenish these essential, natural lawnmowers of the reef before we exceed the tipping point for corals on our O'ahu reefs.

Mahalo,

Edward E. DeMartini, Ph.D.

Kaneohe, Hawai'i

Retired Fisheries Research Biologist, NOAA, NMFS (1990-2016) and
Adjunct Professor, HIMB, SOEST, University of Hawaii Manoa (2006-present)

Aloha Legislators,

I **strongly support HR69/HCR83/SR104/SCR122** to help save the saviors of O‘ahu’s coral reefs: herbivorous fishes. Parrotfishes (*uhu*), surgeonfishes (*kala, kole, manini*, etc.), chubs (*nenuē*) and other fishes clean reef surfaces, preventing seaweeds from smothering corals. Recent scientific research has shown that the abundance of these fishes around the island of O‘ahu is less than 5% its potential (Donavan et al. 2023 *Transactions of the Royal Society B*). Many reefs around O‘ahu are already degraded from poor land management practices, and the ever-warming ocean is predicted to cause coral bleaching and death every year by 2040 (van Hooidonk et al. 2016 *Scientific Reports*). Please pass these resolutions so that Hawai‘i can take steps to replenish our natural lawnmowers of the reef before it is too late.

Mahalo,
Daniela Escontrela Dieguez
Honolulu, Hawai‘i

Aloha Legislators,

I was born and raised on Oahu and have lived in Hawai'i for all of my 76 years. I am a fisherman, ocean swimmer and a diver, and in my lifetime I have witnessed a clear decline in the number of uhu on Oahu reefs. Therefore I strongly support HR69/HCR83/SR104/SCR122.

I testified in support HB 1689 to protect uhu, and thereby save our coral reef saviors from further severe overexploitation. Parrotfishes (uhu) are a key species that keep our reef surfaces clean so new coral can flourish. Unfortunately, uhu are severely depleted and the new herbivore fishing rules approved by the Board of Land and Natural Resources are insufficient to replenish these reef saviors.

Importantly, protecting uhu is about much more than fishing and feeding people. They are the natural resilience mechanism needed for our reefs to recover and thrive. As saviors of our reefs, they are far more valuable to all the people of Hawai'i alive than as food. Healthy coral reefs protect our coasts from erosion, provide fisheries for many species (not just herbivores), and are valuable sources of recreation, tourism, and spiritual connection.

Our reefs are seriously threatened by poor water quality and increasingly severe coral bleaching. Without abundant and diverse populations of uhu, many of Oahu's reefs are now covered in seaweeds, which quickly smother corals unless they are removed by these natural lawnmowers.

Uhu replenishment is about the long-term perspective of those who care about the future of our valuable coral reefs vs. the short-term perspective of those who would continue to allow the depletion of our reef saviors. Ultimately, by helping to replenish uhu populations now, HR69/HCR83/SR104/SCR122 will help sustain our fisheries and other benefits provided by our coral reefs, far into the future.

Mahalo,
Rick Gaffney

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature

Aloha Legislators,

Re: Support for House Resolution HR69/HCR83/SR104/SCR122

My name is Rosemary Alles, I am a long-time resident of the Big Island and am keenly interested in the protection of earth's remaining fauna and flora. I am also the president of the Global March for Elephants and Rhinos (GMFER); our work underlines the grave reality of the 6th mass extinction. Unlike previous mass extinctions, the 6th is driven by human activity. Every unique biosphere on earth -even Antarctica- is experiencing the impact of anthropogenic stresses.

Humans stand at a unique crossroads, one that calls on us to engage in right-action, pono-action. The once vibrant rainbow that mirrored the historic abundance of Hawai'i's jeweled species is no more, still, what remains of that rainbow must be protected.

I, along with GMFER's board and its members call on those who have capacity and the power, Hawai'i's Legislature, to **act today** to protect our island home's remaining coral reefs.

I strongly support HR69/HCR83/SR104/SCR122 to help save the saviors of O'ahu's coral reefs: herbivorous fishes. Parrotfishes (uhu), surgeonfishes (kala, kole, manini, etc.), chubs (nenu) and other fishes clean reef surfaces, preventing seaweeds from smothering corals. Recent scientific research has shown that the abundance of these fishes around the island of O'ahu is less than 5% its potential (Donovan et al. 2023 Transactions of the Royal Society B). Many reefs around O'ahu are already degraded from poor land management practices, and the ever-warming ocean is predicted to cause coral bleaching and death every year by 2040 (van Hooidonk et al. 2016 Scientific Reports). Please pass these resolutions so that Hawai'i can take steps to replenish our natural lawnmowers of the reef before it is too late.

Mahalo nui

Rosemary Alles,
Honokaa, HI.

The mission of the Global March for Elephants and Rhinos (#GMFER) is to #MarchAgainstExtinction and work with indigenous communities to influence governments and world leaders to STOP the poaching of elephants and rhinos. GMFER visions a livable earth for all living things by building human communities that see non-human communities as deserving of justice.

Melissa Pavlicek
1099 Alakea Street, Suite 2530
Honolulu, Hawaii 9813

March 8, 2024

HCR 83, HR 69, SR 104, and SCR122:

REQUESTING THE DEPARTMENT OF LAND AND NATURAL RESOURCES TO WORK WITH THE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION AND OTHER EXPERTS TO CONDUCT A STUDY ON THE POPULATION STATUS OF CORAL REEF HERBIVORES AROUND THE ISLAND OF OAHU AND DEVELOP EFFECTIVE POLICIES FOR SUBSTANTIALLY INCREASING THOSE POPULATIONS WITHIN A DECADE.

Aloha kākou:

My name is Melissa Pavlicek and I serve as an attorney and small business owner based in Honolulu. I am also a parent who is personally concerned about the population status of coral reef herbivores. I care about the future of our oceans for my children, my community, and all of our future generations.

I understand that studies have indicated that herbivores which are necessary for reef health around the island of O'ahu may comprise less than 5% of their potential. Through my work as an advocate at the state capitol, I have had the opportunity to learn about this important issue from Dr. Mark Hixon from the University of Hawaii who refers to herbivores as nature's "lawnmowers." I am especially concerned that a major contributor to reef herbivore depletion is illegal/unethical spearing of these fish at night.

The introduction of these resolutions could not be timelier. Pilina Kanaloa – Ocean Day at the State Capitol – will be held during the month of March to raise awareness about significant ocean policy issues, environmental sustainability, and natural resource protection and restoration.

Please support these measures.

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature
Aloha Legislators,

Writing as a member on behalf of the 'Big Island Reef Keepers hui', we support HR69/HCR83/SR104/SCR122 to help save all herbivorous fishes, and especially our 'Uhu' (Parrotfish). And though we feel the science and data has already clearly shown the importance of the *ecologic services* provided by these animals on our reefs, we think additional studies will only lead to the same conclusions as advocates for HB 1689 have similarly presented.

It's difficult to understand a system that doesn't properly accord the important field work of scientists, nor take to heart the ample body of indigenous wisdom that plans for long term sustainability - throughout generations and not just election cycles!

Please pass these resolutions now so that Hawai'i can take the necessary steps to replenish our natural 'tools' for reef recovery before it is too late.

R A Culbertson
Member, on behalf of the Big Island Reef Keepers hui
Honokaa

Matthew Gurewitsch – 3415 Kuaua Place – Kihei HI 96753

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature

Aloha Legislators,

Time is not on our side.

I write to express my whole-hearted support for HR69/HCR83 and similar Senate resolutions to save the herbivorous fish on O'ahu's coral reefs. These species—which include parrotfishes (*uhu*), surgeonfishes (*kala, kole, manini*, etc.), chubs (*nenue*) and more—are the indispensable safeguard for the health of the reefs. Their cleaning action prevents the buildup of seaweeds that otherwise smother the coral.

Mālama 'āina!

We pride ourselves in Hawaii on our stewardship of the environment. Yet poor land-management practices and a warming ocean have decimated the herbivorous fish stocks in the O'ahu water to just five percent (5%) of their potential (see Donahue et al. 2023 *Transactions of the Royal Society B*).

Five percent! This is as shameful as it is tragic. The situation demands our urgent attention—and our action before we've lost everything. Let's push back with every means at our disposal. Passing these resolutions is the necessary first step. Help the reef flourish!

Mahalo,

Matthew Gurewitsch
3/8/24

HR69/HCR83/SR104/SCR122

We strongly urge you to protect the future of O'ahu's herbivorous fishes and **support** HR69/HCR83/SR104/SCR122.

O'ahu's fragile reef ecosystems are already plagued with invasive species, poor land management practices, warmer waters, and increased acidity. Recent scientific research has shown that the abundance of herbivorous fishes around the island of O'ahu is less than 5% its potential (Donovan et al. 2023 Transactions of the Royal Society B). The reefs need these herbivorous species to play their critical ecological role more than ever and we hope you will **SUPPORT** these resolutions.

Re: **HR69/HCR83/SR104/SCR122**

Dear Legislators,

I moved to Maui from Oahu in 1987 but returned in 2018 – 2020 to study marine biology at Mānoa. It was shocking to see the condition of the Oahu nearshore at that time. The reefs off Waikiki were so eroded they looked like Swiss cheese and had only a few fishes. Even off Lanikai where there were some fishes, they were all very small. Maui reefs are also degraded from pollution and overfishing, but do not approach the devastation of Oahu.

We know we cannot avoid the threats from climate change: extreme weather events, warming seas, and ocean acidification. However, there are local harms that we can mitigate. Controlling non-point source pollution and curbing irresponsible fishing practices, such as night scuba fishing, would give the reefs a measure of resilience to meet global threats. More protected areas would give the reefs a chance to repopulate adjacent nearshore.

I urge you to take seriously the declining reefs of the main Hawai'i islands and **support these resolutions** to protect them.

Diane E Shepherd, DVM
3329 Kehala Dr
Kihei, HI 96753
808-283-2024

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature

Aloha Legislators,

I strongly support **HR69/HCR83** and all Senate resolutions to protect herbivorous fishes of O'ahu's coral reefs, including parrotfishes (uhu), surgeonfishes (kala, kole, manini), chubs (nenuue). These **fishes keep our reefs alive and healthy** by feeding on the seaweeds and algae that smother corals if left to grow unchecked.

Corals are living animals. They create the structures of reefs. Healthy coral reefs sustain Hawai'i by protecting coastlines from storms and erosion, providing jobs for our communities, offering tourism and recreational activity, and are sources of food and medicine for treating cancer. Our people depend on reefs for food, income, and protection. The reef ecosystems are culturally important to us.

But our reefs are severely threatened by human activity. Pollution. Poor waste management practices in coastal zones. Sedimentation. Unsustainable fishing practices. Climate change that warms ocean temperatures and leads to ocean acidification. All these threats can stress corals and lead to coral bleaching and possible coral death. And coral bleaching and death are predicted to increase and occur every year by 2040 (van Hooidonk et al. 2016 Scientific Reports).

Sometimes coral damage is permanent. But **corals can recover from bleaching events and other stressors if conditions improve before they die. We can help our reefs survive by protecting the fish that protect the reefs.** It takes many years for these ecosystems to fully heal, so **we need to start now.**

Scientific research has shown that the abundance of herbivorous fishes around the island of O'ahu is less than 5% its potential (Donovan et al. 2023 Transactions of the Royal Society B). **It can take up to a decade to recover depleted fish stock, so we need to start now.**

Please pass these resolutions so that Hawai'i can take steps to replenish our natural lawnmowers of the reef before it is too late.

Mahalo,
Sarita Rich
Honolulu, Hawai'i

House Speaker Saiki,
Senate President Kouchi, and
Members of the Hawai'i State Legislature

Aloha Legislators,

I strongly support HR69/HCR83/SR104/SCR122 to protect the herbivores of coral reefs. Please save the parrotfishes (uhu), surgeonfishes (kala, kole, manini), chubs (nenuue) because they keep our reefs healthy.

My name is Stella Rich and I'm a 3rd grader at Voyager Public Charter School. Today, I would like to speak up for the herbivores.

Herbivores keep our reefs healthy by eating algae that suffocate coral if left to grow out of control. Uhu also chomp dead coral with their beaks and teeth and then excrete clean sand. Some kinds of uhu produce up to 2000 pounds of sand individually, *every* year. Hawaii needs all of this sand.

I moved to Hawaii 5 years ago. Before I lived here I didn't know about herbivores like parrotfish. I discovered them while doing research for a local art contest about acts of kindness. I found out how amazing parrotfish are and what they do for the environment and wanted to paint them because **fish deserve kindness too.**

Voting to save the herbivores is an important way to "malama ka aina." When your grandchildren ask if you took the chance to save the coral reefs by saving the fishes, that you will be able to say YES! Please say yes to choices that preserve both the land and our people so that keiki like me can grow up in a healthy Hawai'i.

Mahalo,
Stella Rich
Honolulu, Hawai'i

House Speaker Saiki,

Senate President Kouchi, and Members of the Hawai'i State Legislature

Aloha Legislators,

I strongly support HR69/HCR83 and similar Senate resolutions SR104/SCR122 to help save the saviors of O'ahu's coral reefs: herbivorous fishes. Parrotfishes (uhu), surgeonfishes (kala, kole, manini, etc.), chubs (nenu) and other fishes clean reef surfaces, preventing seaweeds from smothering corals.

Since 1977, I have spent thousands of hours underwater studying the behavior and habits of coral reef fishes in Hawai'i, including those on the Island of Oahu. At the beginning of that time, I personally observed very large parrotfishes feeding on bottom algae, reproducing on the reefs, and sleeping quietly in coral crevices at night along our north, west and south shores. Today it is a rare sight to see a large uhu or other herbivorous species, partially because they are the target of many spear and net fisher persons.

Recent scientific research has shown that the abundance of these fishes around the island of O'ahu is less than 5% its potential (Donovan et al. 2023 Transactions of the Royal Society B). Many reefs around O'ahu are already degraded from poor land management practices, and the ever-warming ocean is predicted to cause coral bleaching and death every year by 2040 (van Hoodonk et al. 2016 Scientific Reports). Please pass these resolutions so that Hawai'i can take steps to replenish our natural lawnmowers of the reef before it is too late.

Comments:

In strong SUPPORT of this resolution.

From the passing of DAR’s herbivore rules package in which we do not have sufficient rules to protect our herbivores and coral reefs from further depletion and resilience, to the overwhelming testimony in our attempts to address that outcome in HB1689:

https://www.capitol.hawaii.gov/sessions/session2024/Testimony/HB1689_TESTIMONY_JHA_02-21-24_.PDF

we implore the passing of resolution to address the inadequate protection and the need to address the conditions of O’ahu reefs.

Mahalo,

U’ilani Naipo
